Assignment 2 – Nginx Reverse Proxy with SSL

GitHub Repository

Repository Name: devops-assignment-2-nginx-ssl

What I did

1. Installed and started Nginx in Docker on WSL.
2. Created a sample web application page.
3. Configured Nginx to work as reverse proxy.
4. Generated SSL certificate for HTTPS testing.
5. Configured HTTP to HTTPS redirection.
6. Tested website on localhost and localhost:8080.
7. Verified Nginx page opened successfully in browser.

Configuration Files Used

1. nginx.conf – reverse proxy setup 2. default.conf – port mapping and SSL 3. SSL certificate files – cert.pem and key.pem

Troubleshooting

• Port issue: checked if port 80/443 was already used. • SSL warning: browser showed 'Not Secure' because self-signed certificate. • Nginx restart issue: restarted Docker container.

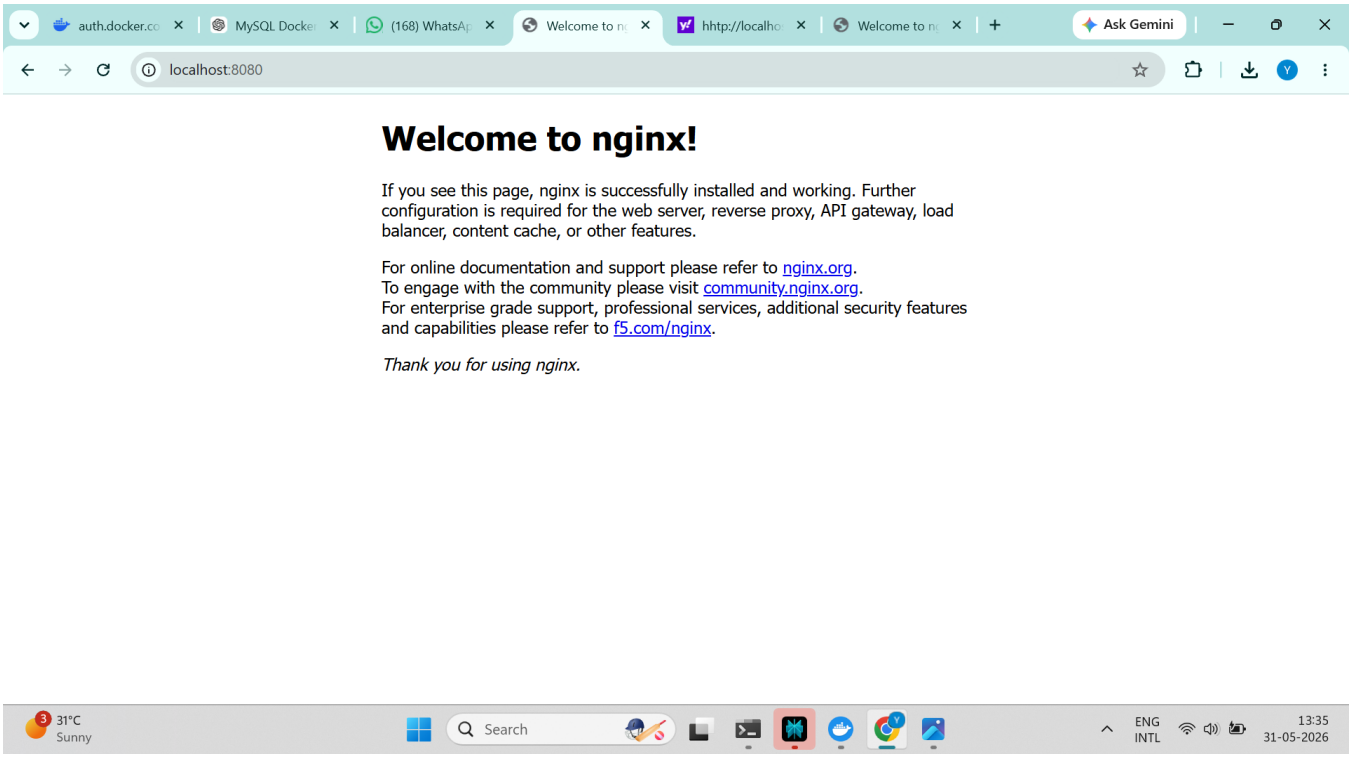

Rollback / Recovery

Stopped Nginx container, checked config, then started again. If needed, reverted to previous config file and reloaded container.

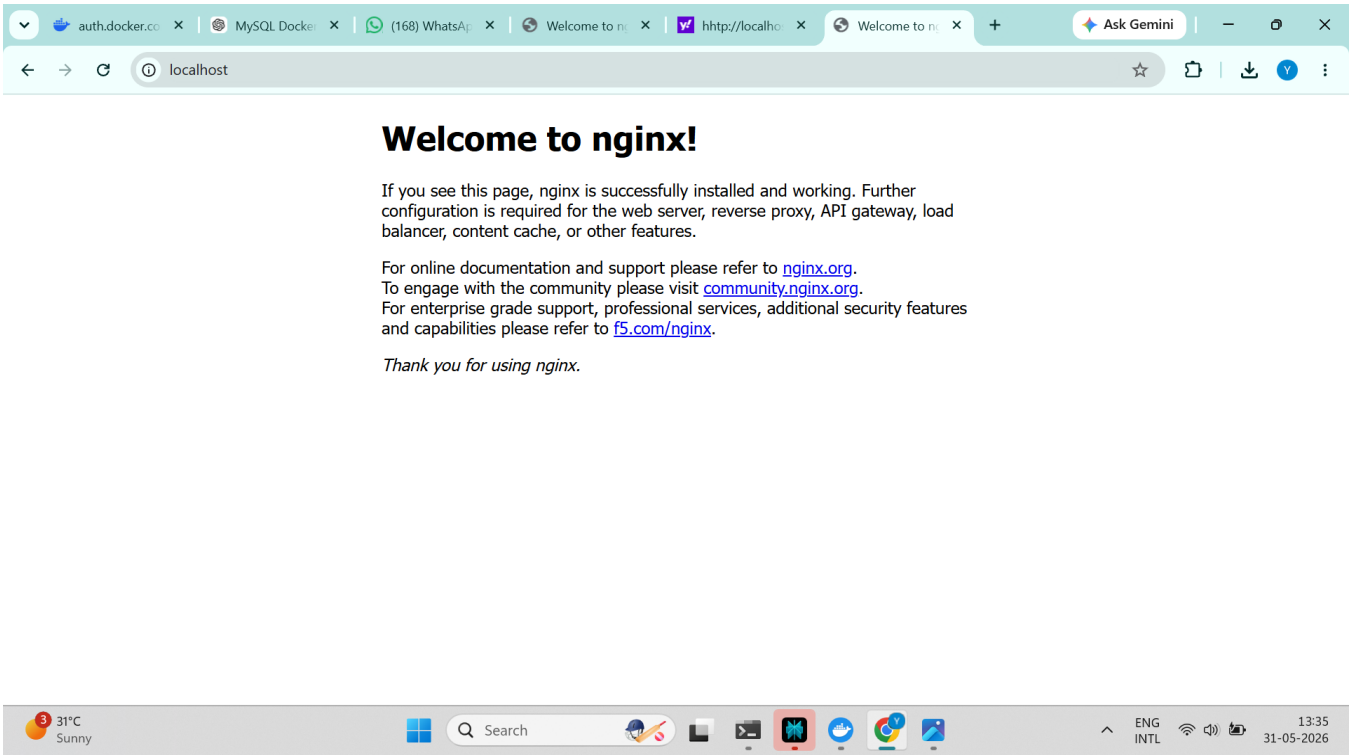

Why I used this setup

I used Docker with Nginx because it is simple to manage in WSL. SSL was configured to test secure access locally. Reverse proxy setup is commonly used in production.
